Physical Twin description

France's natural and anthropized systems behaviour related to ground occupation, construction, in a context of climate change and heavy threat due to human activity.

Digital Twin usages

- Collect and combine 3D geographical data (3D model)
- Offer interaction and visualisation capabilities with the 3D model
- Simulate physical phenomena to better understand impact of action scenarios

Digital Twin Description

The digital twin of France and its territories is a dynamic and prospective digital model of the territory. It aims to provide a technical open source software foundation and 3D open source data set to ease the development of geographical digital twins initiatives in France.

Engineering Digital Twin challenges

By feeding research results and technological choices from its targeted projects (PC) into the JNFT, EDT will strengthen the JNFT's capabilities. In particular: hybrid modeling (PC1), tools and data interoperability (PC2), models lifecycle management and collaborative development (PC3), smart data collection (PC4), human-machine interactions (PC5).
